

PUTTING Heatsavr™ TO USE FOR YOU!

What is Heatsavr?

Heatsavr is a transparent "liquid solar blanket" that greatly reduces heat loss. The liquid forms a barrier on the surface of the pool, inhibiting evaporation. Heatsavr has been tested and proven to be completely safe and biodegradable. Heatsavr is guaranteed to save energy and water, while reducing condensation in your pool.

Energy savings up to 40% can be expected!

Who should use Heatsavr?

- Large or odd shaped pools that can't use conventional pool blankets
- (University's, Condos, Municipalities, High Schools, Fitness Clubs)
- Any customer who doesn't currently use a pool cover and heats their pool or loses temperature over night.
- Customers who find plastic pool blankets to difficult to put on and take off the pool.
- Customers looking for an easier solution to a regular solar blanket.
- Any Facility / Institution / Corporation facing high energy costs.
- Can be used on indoor and heated or non-heated outdoor pools

How does one use Heatsavr effectively?

-
-
-

1 ounce (30 mL) of Heatsavr needs to be added for every 400 square feet (38 square meters) of pool surface area each day. The product can be added either manually by simply pouring directly into the pool or by our automatic metering system. The metering system consists of a peristaltic pump attached to a 7-day programmable timer. When installed to the main return line, the pump will inject the proper dosage daily, ensuring consistent coverage until the jug of Heatsavr is empty. At that time it is necessary to replace the 140-ounce (4.2 L) jug.

Can we use Heatsavr on Spas?

-
-
-

Yes! If using a solid cover already, we recommend they keep using it because of its excellent insulating qualities for the higher temperature water. Heatsavr can be used in conjunction with the solid cover. If there is no cover, Heatsavr can be used to conserve energy. The spa requires a higher dosage because of increased water temperature and higher bather loads. We recommend a dosage of 1 ounce (30mL)/50 square feet (5 square meters) per day.

Is Heatsavr Safe?

-
-
-

Heatsavr is tested and proven to be absolutely safe and completely biodegradable. It is non-corrosive. There is no detrimental effect on pipes, pumps, valves, chlorine controllers, or filters (DE, Sand or Cartridge) commonly used in pool applications. It is coloured slightly blue to be visible for application but is colourless in the water and doesn't stain tiles, vinyl or other pool surfaces. Heatsavr will not affect your water chemistry.

How Heatsavr works!

Heatsavr consists of a 'less dense than water' active ingredient, which are the molecules that create the barrier over the surface of the water. A spreading agent, which is Isopropyl alcohol (IPA) that actually evaporates within 15 minutes of applying the product leaving the active ingredient on the surface of your pool or spa.
